

Hamro Hospital Management System

Backup and Restore Guide

1. Backup Strategy

Use daily PostgreSQL database dumps, daily media backup, weekly full server snapshot and offsite/cloud copy. Keep at least 7 daily backups, 4 weekly backups and 6 monthly backups.

2. Manual Backup

Run: `python manage.py backup_data`. For PostgreSQL production, also run `pg_dump`. Backup media directory separately.

3. Restore Procedure

Put system in maintenance mode, restore database dump, restore media files, run migrations, restart services and verify critical pages.

4. Cloud Backup

Configure cloud provider during deployment. Recommended: encrypted S3-compatible bucket or managed cloud backup.

5. Recovery Drill

Test restoration monthly on a staging machine. Document RTO/RPO expectations for hospital management.
