1. Why PostgreSQL

SQLite is suitable for local development. PostgreSQL is recommended for production concurrency, data safety and reporting performance.

2. Environment Variables

[illegible]

3. Migration Steps

Install PostgreSQL, create database/user, set environment variables, install requirements, run `python manage.py migrate`, create superuser/demo accounts if required, collect static files and test.

4. Backup Commands

`pg_dump -Fc hamro_hospital > backup.dump`. Restore with `pg_restore -d hamro_hospital backup.dump`.

5. Performance Notes

Use SSD storage, tune `shared_buffers/work_mem` according to RAM, enable routine vacuum/analyze and create indexes for high-traffic search fields.
